Welcome!

This site compiles the content seen during our lectures* to study and prepare for assignments.
There should be maybe two or three posts with class notes in total by the end of the semester.

If you don't know what I'm talking about, maybe you shouldn't be here...

* The content which I was assigned to compile.

Acknowledgements

The cats present in the background are (in order: left-to-right, top-to-bottom before loop): [Lis, Komi, Aoi], Las Tres Marías, Atolín's new BFF, Atún, Tamal, Coco, Osita, Susy, Dominic's cat, Tigresa, Salem, Pancha, Taffy, Evil Osita, Nami, Gatita, Machito, Ligio, maybe Tomás, and Tigra.

Special thanks to ChatGPT for absolutely ruining online browsing.

Peter Naur (1928 - 2016)

Peter Naur was an astronomer from Denmark with a Ph.D. and a Turing Award winner in 2005. He was amazed with computers. He was a member of the ALGOL 60 committee, where he helped define and create the ALGOL language. He also improved BNF.

That's him.

Previously, we heard of the Backus Normal Form (BNF) for describing context-free languages. Now, we call it the Backus-Naur Form, thus making BNF an improved version of BNF.

FORTRAN

Stands for Formula Translation.

It was made by John Backus in 1956 and became the first general-use high-level language.

It introduced the feature of comments in a programming language using the symbol 'C'.

C this? 'Tis a comment.

Many newer versions have been created since. It is still used to this day, specially for High Performance Computing.

FORTRAN STATEMENT			
LINE NO.	CHARACTER POSITION	STATEMENT	REMARKS
1	1	PROGRAM FOR FINDING THE LARGEST VALUE	
2	1	ATTAINED BY A SET OF NUMBERS	
3	1	DIMENSION A(999)	
4	1	FREQUENCY 50(2,1,10), 51100	
5	1	READ 1, N, SALL, 1 = 1, N	
6	1	FORMAT (13Y(12) 6.23)	
7	1	BIGA = A(1)	
8	1	DO 20 I = 2, N	
9	1	IF (BIGA - A(I)) 10, 20, 20	
10	1	BIGA = A(I)	
11	1	CONTINUE	
12	1	PRINT 2, N, BIGA	
13	1	FORMAT (22H THE LARGEST OF THESE 19, 124 NUMBERS IS 27.23)	
14	1	STOP 71777	

A Fortran "Statement Sheet" or "Coding Form" for preparing code to be copied onto a punch card.

A deck of Fortran cards.

Compilers and Interpreters

Notes by Aradia Aguilar-Vargas

- ▼ 2026/08/06
 - [Peter Naur](#)
 - [The Big Four](#)
 - [FORTRAN](#)
 - [LISP](#)
 - [COBOL](#)
 - [ALGOL](#)
 - [von Neumann Architecture](#)
 - [Reminders](#)

LISP

Stands for List Processing. It was designed for Artificial Intelligence and it can be used as a Functional-paradigm language.

It was made in the 1950s by John McCarthy.

It's known for leading to many parentheses for relatively simple statements. It consists of atoms and lists.

Several variants exist, such as Scheme, Clojure, and Common Lisp.

Operators use a prefix notation, unlike most non-Functional languages.

Math Operation	(+ 1 2) (+ 1 2 3 4)	1 + 2 1 + 2 + 3 + 4
Variable Assignment	(defvar my-name "David")	my-name = "David"
Invoking Functions	(write-line "Hello world")	printf("Hello world")
If, Else	(if (> 2 3) "bigger" "smaller")	if (2 > 3){ "bigger" } else "smaller"
Function definition	(defun add (a b) (+ a b))	int add(int a,int b){ return a + b; }

Basic LISP syntax.

```
DEFINE
(( ( (RVRSE, (LAMBDA, (L), (COND, ( (NULL, L), NIL),
      (T, (CONS, (RVRSE, (CDR, L)), (CONS, (CAR, L), NIL)))))),
  (RVDE, (LAMBDA, (L), (REV, L, NIL))),
  (REV, (LAMBDA, (J, K), (COND, ( (NULL, J), K),
      (T, (REV, (CDR, J), (CONS, (CAR, J), K)))))))
()
RVRSE ((A,B,C,D,E)) ()
RVDE  ((A,B,C,D,E)) ()
```

An example of LISP code where the overabundance of parentheses is evident.

Compilers and Interpreters

Notes by Aradia Aguilar-Vargas

- ▼ 2026/08/06
 - [Peter Naur](#)
 - [The Big Four](#)
 - [FORTRAN](#)
 - [LISP](#)
 - [COBOL](#)
 - [ALGOL](#)
 - [von Neumann Architecture](#)
 - [Reminders](#)

COBOL

Stands for Common Business-Oriented Language. It was meant to be very similar to the natural English language so the code is self-documented. As a result of this, programs became way too large and were difficult to maintain because of the many reserved words the language had.

It was made in 1959 by Grace Hopper. It is still heavily used, it's present in many instances of legacy code.

⚠ Warning

We saw some statistics in class detailing the current use of COBOL accross the industry and universities worldwide. However, the article has many "ChapGPT-isms" and doesn't cite any real sources for their data, so I'd suggest taking it with a grain of salt or two. You can find the article [here](#).

```

Command ***>                                         Scroll ***> C5R
***** ***** Top of Data *****
000001  IDENTIFICATION DIVISION.
000002  PROGRAM-ID.  QUASAR.
000003
000004  ENVIRONMENT DIVISION.
000005
000006  CONFIGURATION SECTION.
000007  SOURCE-COMPUTER.  DELL.
000008  OBJECT-COMPUTER.  DELL.
000009
000010  INPUT-OUTPUT SECTION.
000011
000012  DATA DIVISION.
000013  WORKING-STORAGE SECTION.
000014  01  EMPLOYEE-RECORD.
000015
000016      02  EMP-NAME.
000017      03  EMP-FNAME          PIC X(10) VALUE "QUASAR".
000018      02  FILLER              PIC X(11) VALUE SPACE.
```

An example of COBOL code. Note the 'divisions' of code.

The use of COBOL cripples the mind; its teaching should, therefore, be regarded as a criminal offence.

A quote from Edsger W. Dijkstra's "[EWD 498: How do we tell truths that might hurt?](#)" manuscript that mentions COBOL.

ALGOL

Stands for Algorithmic Language. It was meant to solve issues that FORTRAN had (which were plenty). It introduced the concepts of begin and end blocks, value and reference calls, local variables, then / else expressions, and others. Most modern languages are ALGOL-like.

It was designed by Peter Naur in 1958 and first described in BNF. The language wasn't very commercially successful, but it was important in academia.

That's him again.

```
procedure Absmax(a) Size:(n, m) Result:(y) Subscripts:(i, k);
  value n, m; array a; integer n, m, i, k; real y;
  comment The absolute greatest element of the matrix a, of size n by m,
  is copied to y, and the subscripts of this element to i and k;
begin
  integer p, q;
  y := 0; i := k := 1;
  for p := 1 step 1 until n do
    for q := 1 step 1 until m do
      if abs(a[p, q]) > y then
        begin y := abs(a[p, q]);
              i := p; k := q
        end
      end
end Absmax
```

An example of ALGOL code.

von Neumann Architecture

CPU

The Central Processing Unit executes programs, makes calculations, and has fast registers. Moore's Law says that the number of transistors in a circuit or CPU doubles every two years. It is composed of a Control Unit and an Arithmetic Logic Unit.

Control Unit

It's in charge of executing the fetch cycle:

1. Retrieve instruction from memory using the Program Counter.
2. Update the Program Counter.
3. Decode instruction.
4. Decode arguments.
5. Execute instruction.
6. Check for interrupt signals (different from system calls).
7. Go to 1.

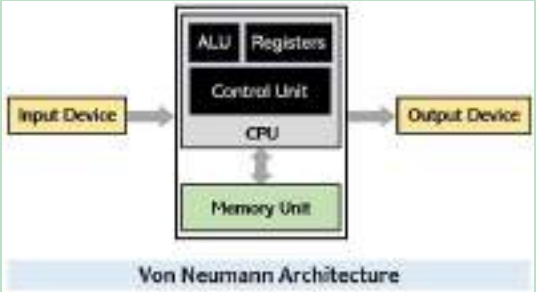

It establishes the computer architecture.

Note: "computer architecture" is interchangeable with "machine language".

There are two basic design possibilities: hardwired or microprogrammed.

Hardwired Timing and Control Unit

It's implemented with logic gates: each machine language instruction has corresponding circuits. It's faster and more efficient than microprogrammed CUs, but they're barely or not at all flexible.

Simple diagram of the von Neumann Architecture.

Reminders

Remember to print the 20 quiz format sheets.
Remember that the specifications for the first project, Project 0, have already been sent.
Remember the moral assignments: find, recognize, and understand code for short programs in the four main high-level languages we've seen so far.
Remember the reading assignments: Chapter 1 of The Language Instinct will be assumed read by August 17th.

Thanks for reading!!
