Welcome!

This site compiles the content seen during our lectures* to study and prepare for assignments.
There should be maybe two or three posts with class notes in total by the end of the semester.
If you don't know what I'm talking about, maybe you shouldn't be here... * The content which I was assigned to compile.

Acknowledgements

External images or GIFs (after 2026/10/15) link to the source from where they were obtained (click "open image in new tab" or "inspect element").
The cats present in the background are (in order: left-to-right, top-to-bottom before loop): [Lis, Komi, Aoi], Las Tres Marías, Atolín's new BFF, Atún, Tamal, Coco, Osita, Susy, Dominic's cat, Tigresa, Salem, Pancha, Taffy, Evil Osita, Nami, Gatita, Machito, Ligio, maybe Tomás, and Tigra. Special thanks to ChatGPT for absolutely ruining online browsing.

Sentential Forms

Definitions

Let G be a Context-Free Grammar where G = (V, Σ, P, S).

1. The string w ∈ (V ∪ Σ)* is a sentential form of G if, and only if, S ⇒* w.
2. The string w ∈ Σ* is a sentence of G if, and only if, S ⇒* w.
3. The language of G (denoted L(G)) is the set {v | v ∈ Σ* ^ S ⇒* w }.
4. The language of G is the set of all sentences of G.

Example

If the context-free grammar G is...

E → E + E
E → E * E
E → a
E → b

then its sentential forms are...

{E, E + E, E + E * E, E * E, a, a + a, b, ...}

and the language of G is...

{a, b, a + a, a + b, a * a, b + a * b, b + b + b + b + b + b, ...}

Leftmost-Rightmost Derivation

Definitions

A derivation is leftmost ("más izquierda", in case that's used in the exam to throw someone off) if the non-terminal closest to the start of the string is always replaced.

A derivation is rightmost ("más derecha", in case that's used in the exam to throw someone off) if the non-terminal closest to the end of the string is always replaced.

A set of strings is a context-free language if it's completely generated by a context-free grammar G and G doesn't generate strings that do not belong to the language.

Leftmost Example

E
⇒ E * E
⇒ E + E * E
⇒ b + E * E
⇒ b + E * E * E
⇒ b + a * E * E
⇒ b + a * a * E
⇒ b + a * a * b

Rightmost Example

E
⇒ E + E
⇒ E + E * E
⇒ E + E * E + E
⇒ E + E * E + b
⇒ E + E * E + E + b
⇒ E + E * E + b + b
⇒ E + E * a + b + b
⇒ E + a * a + b + b
⇒ b + a * a + b + b

Examples of Context-Free Grammars

A CFG that generates a language of strings of 1 or more 'a's.

$S \to a$
$S \to aS$

A CFG that generates a language of strings of 0 or more 'a's.

$S \to \varepsilon$
$S \to aS$

A CFG that generates a language over $\Sigma = \{0, 1\}$ of strings that end in 1.

$S \to A1$
$A \to 1A \mid 0A \mid \varepsilon$

A CFG that generates a language over $\Sigma = \{0, 1\}$ of strings that start with 0 and end in 1.

$S \to 0A1$
$A \to 0A \mid 1A \mid \varepsilon$

A CFG that generates the language $\{a^n b^m \mid n > 0, m > 0\}$ over $\Sigma = \{a, b\}$.

$S \to AB$
$A \to a \mid aA$
$B \to b \mid bB$

A CFG that generates the language $\{a^n b^m \mid n \geq 0, m \geq 0\}$ over $\Sigma = \{a, b\}$.

$S \to AB$
$A \to \varepsilon \mid aA$
$B \to \varepsilon \mid bB$

A CFG that generates the language $\{a^n b^m a^n \mid n > 0, m > 0\}$ over $\Sigma = \{a, b\}$.

$S \to aSa$
$S \to aBa$
$B \to bB$
$B \to b$

A CFG that generates the language $\{a^n b^m c^m d^{2n} \mid n >= 0, m > 0\}$ over $\Sigma = \{a, b, c, d\}$.

$S \to aSdd \mid X$
$X \to bXc \mid bc$

A CFG that generates palindromes over $\Sigma = \{0, 1\}$.

$S \to 0S0 \mid 1S1 \mid \varepsilon \mid 0 \mid 1$

A CFG that generates palindromes over $\Sigma = \{0, 1\}$ with odd length and a 1 in the middle.

$S \to 1 \mid 1S1 \mid 0S0$

A CFG that generates the language $\{a^n b^m \mid 0 \leq n \leq m \leq 2n\}$ over $\Sigma = \{a, b\}$.

$S \to \varepsilon \mid aSb \mid aSbb$

A CFG that generates the language $\{a^n b^n \mid n \geq 0\}$ over $\Sigma = \{a, b\}$.

$S \to \varepsilon \mid aSb$

This creates the first irregular language we made some time ago.

A CFG that generates the language of strings of correctly-nested parentheses.

$S \to \varepsilon \mid (S) \mid SS$

A CFG that generates a language of arithmetic expressions with +, -, *, and parentheses.

Exp → Exp OP Exp
Exp → (Exp)
Exp → <number>
OP → + | - | *

This is a language we'll be trashing and laughing at in the following lectures.

Context-Free Grammar Equivalence

Definition

Two context-free grammars are equivalent if they generate exactly the same language.

Examples

Two equivalent context-free grammars that generate the language a^+b^*.

$$S \to AB$$
$$A \to aA \mid a$$
$$B \to bB \mid \varepsilon$$

and

$$S \to aS \mid aB$$
$$B \to bB \mid \varepsilon$$

Two equivalent context-free grammars that generate the language $a^*ba^*ba^*$.

$$S \to AbAbA$$
$$A \to aA \mid \varepsilon$$

and

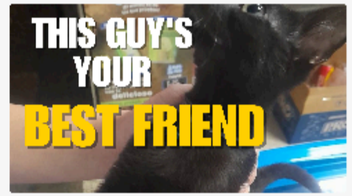

$$S \to aS \mid bA$$
$$A \to aA \mid bC$$
$$C \to aC \mid \varepsilon$$

Regular Grammars

Definition

A regular grammar is a context-free grammar G = (V, Σ, P, S) where all the rules have one of the following forms:

1. A → a (non-terminal → terminal)
2. A → aB (non-terminal → terminal non-terminal)
3. A → ε (non-terminal → ε)

With 'A' and 'B' being members of V and 'a' being a member of Σ, a fourth possible form appears:

4. A → B (non-terminal → non-terminal)

Example

A regular grammar that generates the language $(ab)^{+}a^{*} \mid \varepsilon$.

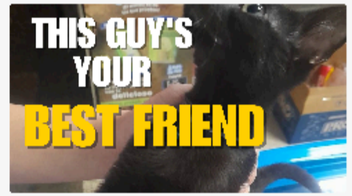

S → aB | ε
B → bS | bA
A → aA | ε

Finite Automata and Regular Grammar Equivalence

Theorem

For every DFA, NFA, or NFA-ε, there is a regular grammar that corresponds to it.

Updated Kleene Theorem

Regular Grammars are now part of our diagram with two-way relationships between every element.

Finite Automata to Regular Grammar Algorithm

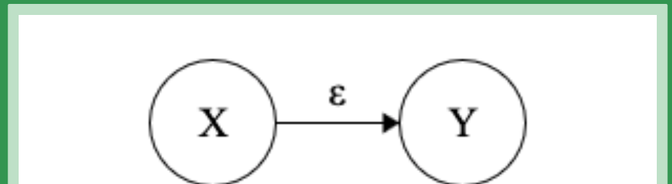

Algorithm

1. A non-terminal corresponds to each state.
   The initial state will be the first symbol.
2. For each transition in the form

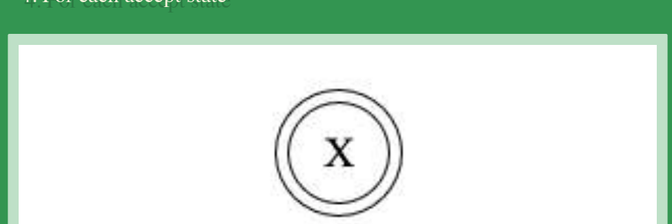

add a rule: X → aY.

3. For each transition in the form

add a rule: X → Y.

4. For each accept state

add a rule: X → ε.

Examples of Finite Automata to Regular Grammar Algorithm

Examples

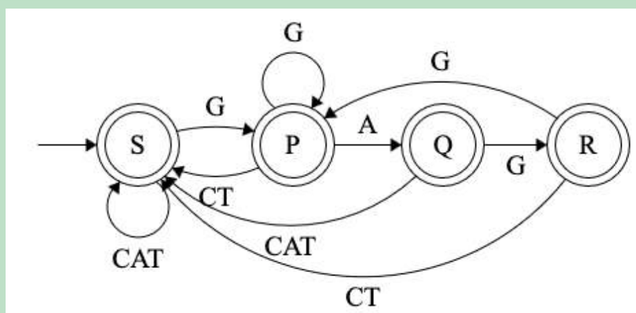

DFA for a language over Σ = {0, 1} of strings ending in 0. The algorithm turns it into this regular grammar:

A → 1A | 0B
B → 0B | 1A | ε

DFA for a language over Σ = {0, 1} of strings not ending in 00. The algorithm turns it into this regular grammar:

A → 1A | 0B | ε
B → 0C | 1A | ε B → 0C | 1A

DFA for a language over Σ = {G, C, A, T} of strings not containing the substring "GAGA". The algorithm turns it into this regular grammar:

S → GP | CS | AS | TS | ε
P → GP | CS | AQ | TS | ε
Q → GR | CS | AS | TS | ε
R → GP | TS | CS | ε
